

CC.03.004 Clinical Practice Guideline: Massive Transfusion Process Obstetric Patient

OB Patient requires 2 units of PRBCs in 2 hours.
IMPORTANT to Call OB MTPs as Early as possible!
MTP initiated Nurse or Attending

Transportation of the blood products is the responsibility of treatment team members.
An order should be in place in eRecord for the MTP.

Blood Bank must have a T&S specimen to provide type specific products.
Type and Screen sample must be sent to the Blood Bank as soon as possible so patient receives blood products most appropriate for transfusion.

Once specimen is received, further shipments will be prepared; attending physician or designee can request shipments by calling the Blood Bank X6544.

A PCT or designee picks up products from the Blood Bank. Products may be in a cooler, or plastic transport basin (see below).

- 1st MTP shipment: 4 RBCs, 4 FFP, 1 dose platelet.
 - 2nd MTP shipment: 4 RBCs, 4 FFP, 1 dose cryoprecipitate.
- These shipments will alternate until the MTP is discontinued.

Shipment Schedule	RBC	Thawed plasma	Plt Dose	Cryo
Initial Release	2 (O Neg or type specific)			
Shipment 1	4 IN Cooler	4 May be delivered in 2 shipments.	1 CSP in Cooler or SDP in basin.	
Shipment 2	4 IN Cooler	4 May be delivered in 2 shipments.		1 In Basin
Subsequent shipments: Repeat shipments 1 and 2 until MTP discontinued				

Infuse all products in each shipment unless the MTP is discontinued.

MTP is Discontinued when:

- Clinician discontinues MTP and notifies Blood Bank
- No products have been requested in more than 1 hour
